

## (5Z,7Z,9Z)-5,10-Dibromobenzo[8]-annulene

Christopher O. Bender and René T. Boeré\*

Department of Chemistry and Biochemistry, University of Lethbridge, Lethbridge, AB, T1K3M4, Canada

Correspondence e-mail: boere@uleth.ca

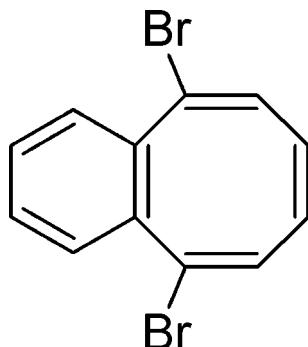

Received 10 September 2013; accepted 10 October 2013

Key indicators: single-crystal X-ray study;  $T = 173\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$ ;  $R$  factor = 0.017;  $wR$  factor = 0.039; data-to-parameter ratio = 19.1.

In the structure of the title compound,  $\text{C}_{12}\text{H}_8\text{Br}_2$ , the two bromine substituents are oriented *exo* to the boat-shaped cyclooctatetraene at the two ring sites that are  $\beta$  to the ring fusion positions. The average  $\text{Br}-\text{C}$  bond distance is  $1.919(2)\text{ \AA}$ , the average distance for  $\text{C}=\text{C}$  double bonds that are  $\text{Br}$  substituted is  $1.328(2)\text{ \AA}$ , while the other two double-bond distances are  $1.327(2)$  and  $1.398(2)\text{ \AA}$  for the non-fused and fused bonds, respectively. Each type of ring interatomic distance is within s.u. of the average values for the four known structures, including the title compound, of benzo-fused cyclooctatetraenes that are not coordinated to a metal atom. The crystal structure features short  $\text{Br}\cdots\text{Br}$  [ $3.6620(3)\text{ \AA}$ ] and  $\text{C}\cdots\text{H}$  [ $2.834(2)$  and  $2.841(2)\text{ \AA}$ ] contacts.

### Experimental

#### Crystal data

$\text{C}_{12}\text{H}_8\text{Br}_2$	$V = 1070.83(11)\text{ \AA}^3$
$M_r = 312.00$	$Z = 4$
Monoclinic, $P2_1/c$	Mo $K\alpha$ radiation
$a = 8.5289(5)\text{ \AA}$	$\mu = 7.52\text{ mm}^{-1}$
$b = 8.3630(5)\text{ \AA}$	$T = 173\text{ K}$
$c = 15.5645(9)\text{ \AA}$	$0.16 \times 0.09 \times 0.08\text{ mm}$
$\beta = 105.2980(6)^\circ$	

#### Data collection

Bruker APEXII CCD area-detector diffractometer	15053 measured reflections
Absorption correction: multi-scan ( <i>SADABS</i> ; Bruker, 2008)	2426 independent reflections
$R_{\text{int}} = 0.023$	2217 reflections with $I > 2\sigma(I)$
$T_{\text{min}} = 0.510$ , $T_{\text{max}} = 0.746$	

#### Refinement

$R[F^2 > 2\sigma(F^2)] = 0.017$	127 parameters
$wR(F^2) = 0.039$	H-atom parameters constrained
$S = 1.04$	$\Delta\rho_{\text{max}} = 0.49\text{ e \AA}^{-3}$
2426 reflections	$\Delta\rho_{\text{min}} = -0.46\text{ e \AA}^{-3}$

Data collection: *APEX2* (Bruker, 2008); cell refinement: *SAINT-Plus* (Bruker, 2008); data reduction: *SAINT-Plus*; program(s) used to solve structure: *SHELXD* (Sheldrick, 2008); program(s) used to refine structure: *SHELXL2013* (Sheldrick, 2008); molecular graphics: *Mercury* (Macrae *et al.*, 2006); software used to prepare material for publication: *publCIF* (Westrip, 2010).

This research was supported by the Natural Sciences and Engineering Research Council of Canada. The diffractometer at the University of Lethbridge X-ray Diffraction Facility was purchased with the help of NSERC and the University.

Supplementary data and figures for this paper are available from the IUCr electronic archives (Reference: HG5345).

## (5Z,7Z,9Z)-5,10-Dibromobenzo[8]annulene

Christopher O. Bender and René T. Boeré

### S1. Comment

The title compound was prepared as a starting material for synthesis of the corresponding dinitrile derivative, which was of interest in connection with studies of the photochemical conversions of benzocyclooctatetraenes (Bender *et al.*, 1982; 1986; 1988; 1991). In view of the paucity of structures that are crystallographically established for mono-benzofused cyclo-octatetraenes, we decided to undertake a crystallographic study of (I).

Only three prior structures have been reported which contain one benzo-fused cyclooctatetraene ring according to the Cambridge Structural Database (Allen, 2002; WebCSD, August 2013), excluding those with rings coordinated to metals. The parent hydrocarbon, (5Z,7Z,9Z)-benzo[8]annulene (refcode BUYYUP), has been structurally characterized by X-ray crystallography and investigated by semi-empirical quantum mechanical methods (Li *et al.*, 1983). The only halogen-substituted example is (8-chlorobenzocyclooctatetraen-6-yl)-diphenylphosphine-oxide (refcode: CUDYUV) but this ring bears a large Ph<sub>2</sub>P=O substituent; this structure contains two independent molecules in the asymmetric unit (Bohshar *et al.*, 1984). In dimethyl 1,4,6,9-tetramethylbenzocyclooctatetraene-5,10-dicarboxylate (refcode: LEZMAE) the two methyl ester substituents are located where the Br atoms are in (I) but this molecule also has four methyl substituents, two attached to the other ends of the same double bonds that the esters are attached to, and two in the 1 and 4 positions of the benzene rings (Jones *et al.*, 1994). Gratifyingly, all the 1,2 interatomic distances in (I) are found to lie within s.u. of the average values from these three comparison structures and (I).

Related benzo-fused cyclooctatrienes which have the same 5,8-dibromo substitution as found in (I) have been structurally characterized. In 5,8,10-tribromo-(8H)-benzocycloocten-7-one (refcode: BOGwav) the cyclooctatriene ring is distorted by saturation at C8 and a ketone group at C7 (Kidokoro *et al.*, 1983), whilst 5,7,7,8,10-pentabromo-7,8-di-hydrobenzocyclooctene (refcode: FABDOC) has C7 with two Br and C8 with H and Br substituents (Çelik *et al.*, 2002). The C5-Br1 and C10-Br2 distances in BOGwav are 1.8822 (3) and 1.9309 (3) Å and in FABDOC 1.912 (7) and 1.896 (9). Thus the average C-Br bond distance in this set of three related structures is 1.910 (16) Å, with the distances in (I) found within s.u. of this value.

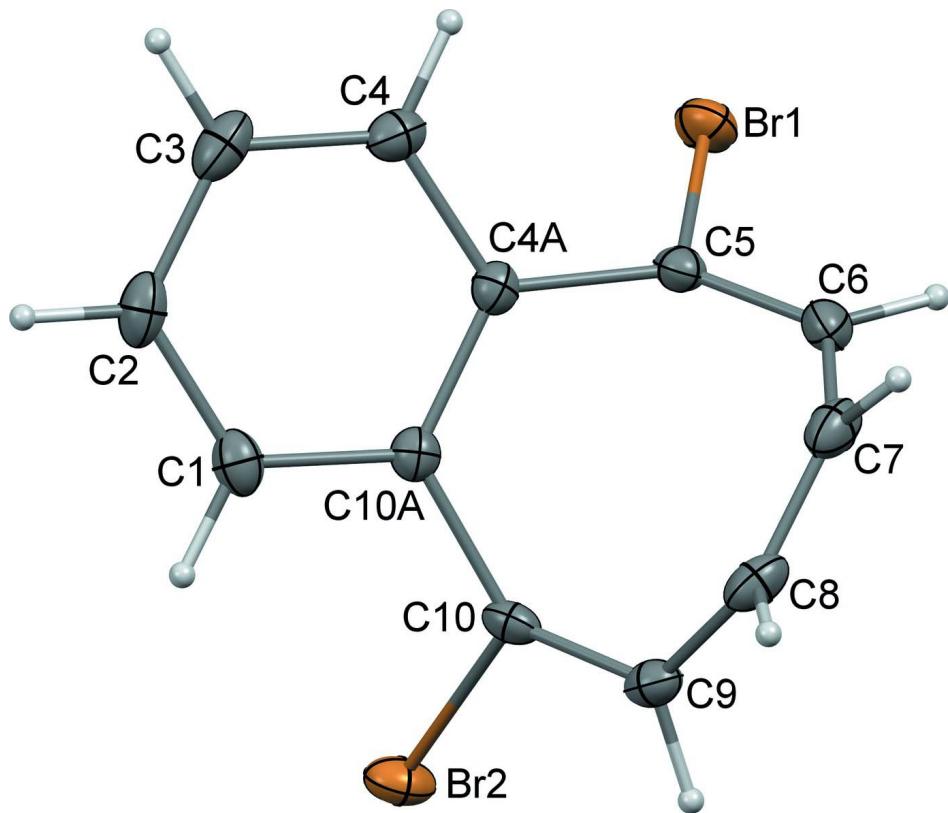

In the crystal structure of (I) molecules are tightly packed. There are three unique short intermolecular contacts (Figure 2), namely C2···H7<sup>i</sup> = H7···C2<sup>ii</sup> = 2.834 (2) Å, Br1···Br2<sup>iii</sup> = 3.6620 (3) Å and C9···H1<sup>iv</sup> = 2.841 (2) Å (symcodes employed: i, 1-x,-1/2+y,1/2-z; ii, 1-x,1/2+y,1/2-z; iii, -x,1-y,-z; iv, 1-x,-y,-z).

### S2. Experimental

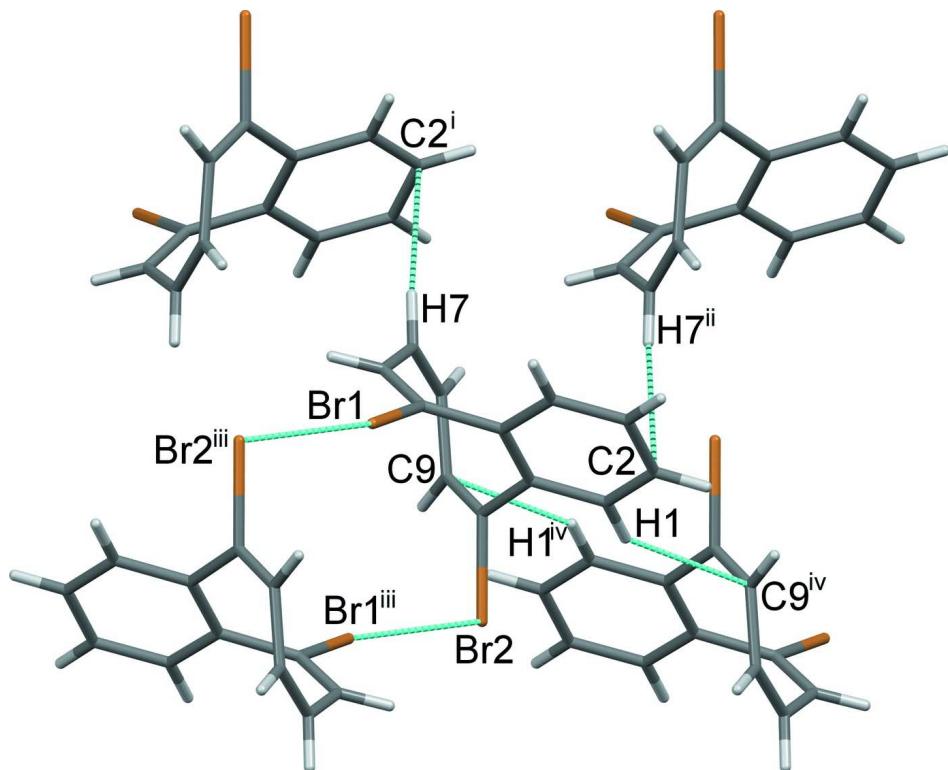

Samples of (I) were prepared from biphenylene via the method of Barton *et al.* (1964). Crystals were obtained from aqueous methanol (m.p. 366–368 K).

**S3. Refinement**

All the hydrogen atoms were located on a difference map, but for purposes of refinement are treated as riding on their attached aromatic carbon atoms with C—H = 0.95 Å and  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ .

**Figure 1**

Molecular structure of (I) drawn with displacement ellipsoids at the 40% probability level, and also showing the atom numbering scheme.

**Figure 2**

View along the  $a$  axis (with  $b$  horizontal and  $c$  vertical) showing the three unique intermolecular contacts (as dashed-line tubes) that are less than the sums of the v.d. Waals' radii of the interacting atoms. (Symcodes: i, 1-x,-1/2+y,1/2-z; ii, 1-x,1/2+y,1/2-z; iii, -x,1-y,-z; iv, 1-x,-y,-z.)

### (5Z,7Z,9Z)-5,10-Dibromobenzo[8]annulene

#### Crystal data

$C_{12}H_8Br_2$   
 $M_r = 312.00$   
Monoclinic,  $P2_1/c$   
 $a = 8.5289$  (5) Å  
 $b = 8.3630$  (5) Å  
 $c = 15.5645$  (9) Å  
 $\beta = 105.2980$  (6) $^\circ$   
 $V = 1070.83$  (11) Å $^3$   
 $Z = 4$   
 $F(000) = 600$

$D_x = 1.935$  Mg m $^{-3}$   
Melting point: 366 K

Graphite monochromator

Detector resolution: 66.06 pixels mm $^{-1}$

$\varphi$  and  $\omega$  scans

Absorption correction: multi-scan  
(SADABS; Bruker, 2008)

$T_{\min} = 0.510$ ,  $T_{\max} = 0.746$

15053 measured reflections

2426 independent reflections

2217 reflections with  $I > 2\sigma(I)$

$R_{\text{int}} = 0.023$

$\theta_{\max} = 27.4^\circ$ ,  $\theta_{\min} = 2.5^\circ$

$h = -11 \rightarrow 11$

$k = -10 \rightarrow 10$

$l = -20 \rightarrow 20$

*Refinement*

Refinement on  $F^2$   
 Least-squares matrix: full  
 $R[F^2 > 2\sigma(F^2)] = 0.017$   
 $wR(F^2) = 0.039$   
 $S = 1.04$   
 2426 reflections  
 127 parameters  
 0 restraints  
 Primary atom site location: dual

Secondary atom site location: difference Fourier map  
 Hydrogen site location: inferred from neighbouring sites  
 H-atom parameters constrained  
 $w = 1/[\sigma^2(F_o^2) + (0.0171P)^2 + 0.5892P]$   
 where  $P = (F_o^2 + 2F_c^2)/3$   
 $(\Delta/\sigma)_{\text{max}} = 0.001$   
 $\Delta\rho_{\text{max}} = 0.49 \text{ e } \text{\AA}^{-3}$   
 $\Delta\rho_{\text{min}} = -0.46 \text{ e } \text{\AA}^{-3}$

*Special details*

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Structure first solved in  $P2_1$ ; used the PLATON "Addsym" tool to find the true space group and refinement continued in  $P2_1/c$  (Spek, 2009).
